## Introduction to the Boston Housing Dataset

The Boston Housing dataset considers housing values and their associated properties in suburbs of Boston, Massachusetts. The dataset contains 506 observations and 14 attributes. We acquired the dataset from the Machine Learning Database (MLDB), found [here](#). In particular, we are interested in constructing a model through regression techniques to gain insight on housing values. As such, we will use the 13 features to model 'MEDV', the median value of owner occupied homes (in \$1,000s).

The data is displayed as follows.

##		CRIM	ZN	INDUS	CHAS	NOX	RM	AGE	DIS	RAD	TAX	PTRATIO	B	LSTAT
## 1	0.00632	18	2.31	0	0.538	6.575	65.2	4.0900	1	296	15.3	396.90	4.98	
## 2	0.02731	0	7.07	0	0.469	6.421	78.9	4.9671	2	242	17.8	396.90	9.14	
## 3	0.02729	0	7.07	0	0.469	7.185	61.1	4.9671	2	242	17.8	392.83	4.03

## 4	33.4													
## 5	36.2													
## 6	28.7													

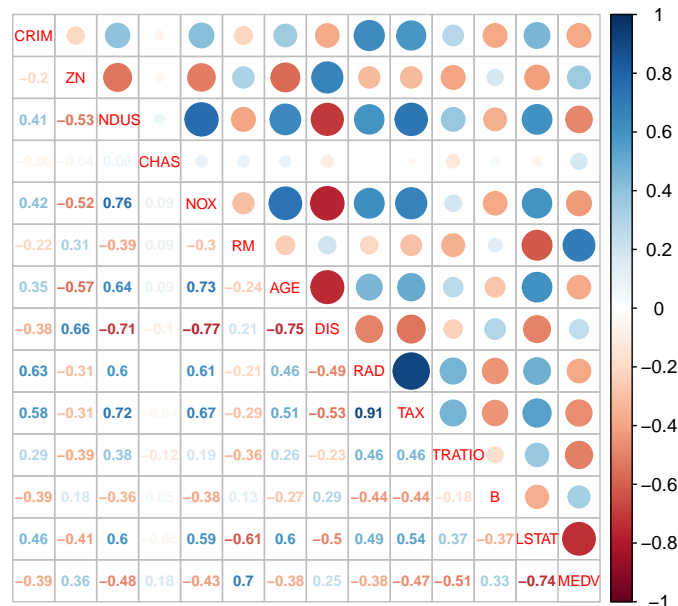

## Exploratory Data Analysis

## MEDV Distribution

The histogram demonstrates the values are not uniformly distributed. Rather, they follow a mostly normal distributions, with some outliers at the tail.

## Correlation Matrix

While we produce many correlation values, we are firstly interested in how each attribute correlates to MEDV. This is represented by the bottom row or last column. We can immediately see the binary CHAS attribute does not correlate strongly with MEDV. However, it can be seen that RM (0.7) and LSTAT (-0.74) correlate with MEDV stronger than other attributes. Furthermore, the correlation between RM and LSTAT is -0.61. Since they do not correlate very strongly with one another, we can select both as predictor attributes without too much concern of collinearity for their case. The greatest correlation is between RAD and TAX

of 0.91. Including both of these may raise some concerns regarding the minimal collinearity assumption of linear regression.

### Example EDA subsection title 3

## Modelling and Regression

MedV takes the value for Y, along 13 feature attributes of the dataset, in the form of  $Y = \beta_0 + \beta_1 x_1 + \dots + \beta_n x_n$ .

### Multiple Linear Regression

This is very subject to change. I chose to simply split the data in a 80/20 split. If you think we should consider another split, or more, please do so. Furthermore, this is simply a start, and have yet to articulate everything. Please feel free to make changes.

Naively consider most attributes at onset.

```
##
## Call:

## F-statistic: 94.76 on 12 and 391 DF,  p-value: < 2.2e-16
```

Some initial insight is that LSTAT and RM indeed were strong predictors. Removing INDUS and AGE, every attribute becomes a significant predictor with the possible exception of B, depending on alpha. Let's consider what happens if we remove RAD, which varies strongly with TAX.

```
##
## Call:
## lm(formula = MEDV ~ CRIM + ZN + NOX + RM + DIS + TAX + PTRATIO +
##      B + LSTAT, data = training)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -11.437  -2.810  -0.353   1.582  27.899
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)  2.450e+01  5.611e+00   4.366 1.62e-05 ***
## CRIM         -7.700e-02  2.871e-02  -2.682  0.00762 **
## ZN           4.011e-02  1.396e-02   2.873  0.00428 **
## NOX        -1.028e+01  3.899e+00  -2.636  0.00871 **
## RM           4.287e+00  4.708e-01   9.106 < 2e-16 ***
## DIS        -1.216e+00  1.987e-01  -6.119 2.27e-09 ***
## TAX        -3.327e-04  2.205e-03  -0.151  0.88013
## PTRATIO     -7.813e-01  1.345e-01  -5.810 1.29e-08 ***
## B           6.784e-03  3.099e-03   2.189  0.02917 *
## LSTAT      -5.418e-01  5.405e-02 -10.025 < 2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 4.553 on 394 degrees of freedom
## Multiple R-squared:  0.7111, Adjusted R-squared:  0.7045
## F-statistic: 107.7 on 9 and 394 DF, p-value: < 2.2e-16
```

We can see that without RAD, TAX is no longer a strong predictor. As such, TAX adds predictive value in relation to RAD. The next model removes TAX and adds RAD back in.

```
##
